Test task for the Front-End developer position

Please write a simple application using the public API with facts about Chuck Norris. The idea is to create a list of favorite facts about that guy.

The following application should be able to get a list of categories and after selecting a particular category the facts should be fetched to the source list. Every or all the source list element could be added to or removed from the custom list and reflected in the state.

Please don't be confused by this a bit "childish" task, because that's how we will see the way you're thinking and planning the development. And don't forget about the basic design (feel free to use angular material and/or bootstrap) ;)

API host: https://matchilling-chuck-norris-jokes-v1.p.rapidapi.com/ API key: 53a61af534mshea943f753441ac9p1a9f6ejsnd6468530352c

All the information about API implementation with examples could be found here: https://rapidapi.com/matchilling/api/chuck-norris

Required technologies:

- Angular 2+
- Redux angular-redux/store

It's possible to achieve bonus points by:

- Drag'n'drop
- Spinner, bacis animation
- Sorting the custom list alphabetically
- RxJS
